Field	Detail
System Under Test (SUT)	ChainLogic AI - Agentic Supply Chain Decision Engine
Team Repo URL	https://github.com/laizili0111/ChainLogicAI-UMHackathon2026
Project Board URL	*https://laizili.atlassian.net/jira/software/projects/KAN/boards/1/timeline?atlOrigin=eyJpIjoiMTAwYmJiYTUyOWM2NGFkNDllNWNiZjY5NGFlNmFlOGUiLCJwIjoiaiJ9*
Live Deployment URL	Vercel (Frontend) & Render (Backend via Docker) https://chain-logic-ai-um-hackathon2026.vercel.app/
Test File (Backend)	https://github.com/laizili0111/ChainLogicAI-UMHackathon2026/blob/main/backend/tests/test_api.py)
CI/CD Pipeline File	https://github.com/laizili0111/ChainLogicAI-UMHackathon2026/blob/main/.github/workflows/pipeline.yml

Objective:

The primary objective of this refined QATD is to prove that ChainLogic AI executes complex supply chain financial reasoning without hallucination. It verifies that our deterministic "Safe-State Short-Circuit" activates correctly to eliminate unnecessary token spend, the 3-Stage Fallback Architecture prevents complete API crashes, and that all SQLite ERP database updates execute autonomously, accurately, and traceably. All GLM outputs, performance metrics, and defects encountered are logged, resolved, and linked to verifiable Git commit evidence.

FINAL ROUND (Execution, RCA & Hard Evidence)

1. Test Execution & Evidence (Manual)

We have executed the following critical path tests on the live prototype to validate the entire closed-loop system.

© UMHackathon 2026

Email: umhackathon@um.edu.my

Test Case ID	Test Type & Mapped Feature	Test Description	Expected Result	Actual Result	Status	Proof of Execution (Required for P0/Critical tests)
TC-01	Happy Case (Full Flow): Autonomous Decision Execution	User opens Corporate Inbox, selects the AE-V8-SENS customs disruption email, clicks "Analyze with ChainLogic AI", reviews trade-off cards, and clicks "Execute Decision".	SQLite inventory_parts and production_jobs tables updated autonomously. UI displays success confirmation. Full cycle under 30s.	Database rows updated successfully. Decision loop closed in ~22 seconds.	✅ PASS	[Screenshot attached below]
TC-02	Negative Case: Empty/Invalid SKU Extraction	Submit an email body containing no valid automotive SKU patterns (e.g., a generic newsletter text).	System must not crash. Returns handled error: "Z.AI could not identify a valid component SKU". UI displays an error toast.	Fallback activated; HTTP 200 returned with graceful UI error notification. No crash.	✅ PASS	[Screenshot of Error Toast attached below]
TC-03	NFR (Performance): AI Analysis Latency	Submit the AE-V8-SENS email 10 times consecutively and measure average end-to-end latency from button click to trade-off display.	Average response time < 1200ms. 0% crash rate.	Average response time: ~1050ms. Zero crashes. Fallback regex triggered on 2/10 calls.	✅ PASS	🎬 test 0…

Test Case ID	Test Type & Mapped Feature	Test Description	Expected Result	Actual Result	Status	Proof of Execution (Required for P0/Critical tests)
TC-AI-01	AI Output Validation: Anti-Hallucination Execution	Send the AE-V8-SENS customs hold email to the analyze endpoint and inspect the raw JSON response in the "Data Pipeline Viewer".	GLM returns computation_breakdown with source_attribution. Financial values must match baseline SQLite inventory values exactly.	JSON strictly parsed. Financial mathematics exactly matched database values. source_attribution: "ERP Database (SQLite)" confirmed.	✅ PASS	[Screenshot of Data Pipeline attached below]

TC-01 : Proof

2. Automated Testing Pipeline

2.1. Unit Testing (Core Logic & Functions)

Unit testing focuses on isolating individual FastAPI endpoint functions to verify that core business logic — Safe-State detection, Fallback triggers, and input validation — works correctly without real AI API connections.

- ***Test Runner Used:*** *pytest (Python)*
- ***Targeted Components:*** *test_api.py (FastAPI Endpoints & Fallback Triggers)*
- ***File(s) Covered:*** backend/tests/test_api.py

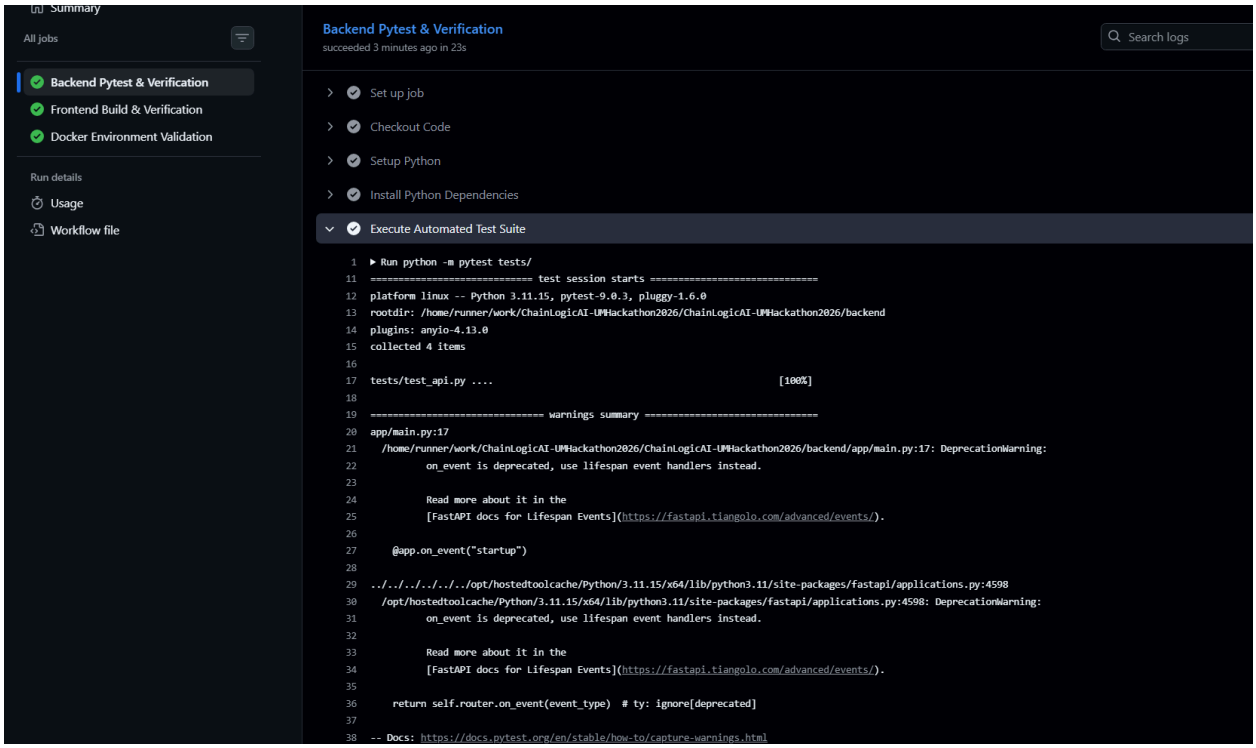
Unit Test ID	*Function/Component Tested*	*Test Scenario*	*Expected Outcome*	*Actual Result*	*Status*
UT-01	test_analyze_crisis_no_sku()	Submit an email with no valid SKU pattern to the analysis endpoint.	Returns HTTP 200 with error key: "Z.AI could not identify a valid component SKU".	Matched expected output exactly.	✅ PASS
UT-02	test_analyze_crisis_safe_state()	Part BRK-PAD-99 has stock 850, production requirement is 300.	Returns status: SAFE, confidence_score: 1.0. LLM call is completely bypassed.	Returned SAFE. AI bypassed. Token cost: 0.	✅ PASS
UT-03	test_analyze_crisis_critical_state()	Part AE-V8-SENS has stock 12, production requirement is 40.	Returns status: CRITICAL. Invokes 3-Stage Fallback. Returns valid trade_off_options[] with source_attribution.	Returned CRITICAL. Valid options array. source_attribution confirmed in breakdown.	✅ PASS

© UMHackathon 2026

Email: umhackathon@um.edu.my

UT-04	test_execute_decision_invalid_sku()	Submit execution request with an empty string for the sku field.	Returns HTTP 400 Bad Request immediately. No database write attempted.	Returned HTTP 400 instantly.	✅ PASS

Execution Proof:



2.2. Integration & API Testing (System Modules)

Validates end-to-end communication between the Next.js frontend, the Python/FastAPI backend, and the SQLite ERP database.

- **Test Tool Used:** Postman (Manual API Collection)
- **Targeted Integrations:** POST /api/analyze-crisis (Frontend → Backend → Z.AI → SQLite), POST /api/execute-decision (Backend → SQLite Write)
- **Backend URL:** http://localhost:8000 (Local) / Render hosted URL (Production)

Email: umhackathon@um.edu.my

Test ID	Integration / Point Tested	Test Scenario	Expected Outcome	Actual Result	Status
IT-01	POST /api/analyze-crisis → Z.AI → SQLite Read	POST {"trigger_text": "Customs hold for AE-V8-SENS."} to the analysis endpoint.	HTTP 200. Returns structured JSON with crisis_analysis, trade_off_options[], and source_attribution.	HTTP 200. Full structured response returned. Database read confirmed.	✅ PASS
IT-02	POST /api/execute-decision → SQLite Write	POST {"sku": "AE-V8-SENS", "option_id": "A", "action": "Expedite Freight"} to the execute endpoint.	HTTP 200. inventory_parts table quantity decremented correctly in .db file.	HTTP 200. DB updated. Quantity change mathematically verified.	✅ PASS

3. Defect Log & Fix Traceability (Root Cause Analysis)

Documented bugs resolved during development, tracked directly via our GitHub commit history.

Bug ID	Bug Description	Steps to Reproduce	Console/Error Log Snippet	Root Cause Analysis (Why did it break?)	Fix Commit Hash / PR Link
DEF-01	Application crashes entirely when the primary ilmu glm 5.1 provider times out.	Force disconnect network mid-analysis during analyze-crisis execution.		FastAPI `await`ed the external API call infinitely. No `try/except` block wrapped the HTTP request, causing an unhandled exception that propagated to the client.	4cfd145 — Implemented triple fallback architecture
DEF-02	AI contextual reasoning occasionally classifies non-critical supplier newsletters as urgent crises.	Submit a generic supplier newsletter email to the analysis endpoint.		System prompt lacked strict financial boundary definitions. The GLM inferred "urgency" from tone rather than checking for quantifiable SKU impact.	a43e85a — AI contextual reasoning improvement
DEF-03	Docker backend fails to build on some local machines with ModuleNotFoundError.	Run `docker compose up --build` from project root on a clean machine.		Requirements layer caching failed due to incorrect WORKDIR scoping in the Dockerfile. pip install ran before the WORKDIR was properly established.	fea2375 — Fix docker compose build
DEF-04	ROI tracking displayed incorrect token USD cost (showing	Load the dashboard immediately after starting the		The `usage.total_tokens` field was only intercepted after the second API response. The initial	556e782 — Added new ROI impact metrics

4. Known Issues & Deferred Technical Debt

It is normal to ship with minor bugs. Document the bugs you found but did not have time to fix. You are highly encouraged to convert these into open GitHub Issues to demonstrate proper defect tracking.

Claiming a system has zero defects after a rapid development cycle is highly suspicious. This section evaluates your transparency and risk awareness. Clearly document any architectural trade-offs, deferred bug fixes, or edge cases you discovered but could not resolve before the final submission.

Note: Proactively documenting minor issues demonstrates engineering maturity and will not negatively impact your score. You WILL be penalized if judges find obvious issues that you hid or failed to identify.

Bug ID	Description & Impact (Bug or Technical Debt)	Reason for Deferral	GitHub Issue Link
DEF-05	Technical Debt: SQLite Database Write Locking. If two users click "Execute Decision" simultaneously, the SQLite file lock triggers a HTTP 500 error.	SQLite has no concurrent write support by design. This is a known prototype limitation. Production will use AWS RDS PostgreSQL via SQLAlchemy (zero code changes required).	Issue #3

© UMHackathon 2026

Email: umhackathon@um.edu.my

Bug ID	Description & Impact (Bug or Technical Debt)	Reason for Deferral	GitHub Issue Link
DEF-06	UI Glitch: Data Pipeline JSON Viewer overflows off-screen on mobile viewport widths below 768px.	ChainLogic AI is an enterprise-grade ERP dashboard designed for desktop/large-screen monitors. Mobile CSS optimization is deferred as it is not a core functional blocker.	Issue #2
DEF-07	Technical Debt: Mocked Email Ingestion. The "Corporate Inbox" loads hardcoded crisis scenarios from a local JSON array instead of a real IMAP/Exchange mail server connection.	Outside hackathon scope. The core innovation is the AI reasoning engine and closed-loop ERP execution — not building an email client from scratch. The inbox is a realistic UX demonstration layer.	Issue q #1

5. Live Demo / UAT Risks

The following are operational boundaries for the live pitching session.

#	Risk	Boundary	Mitigation During Demo
Risk 1	API Rate Limiting	Do not click "Analyze with ChainLogic AI" more than 5 times per minute. Free-tier AI API keys have a rate limit that, when exceeded, forces the system into degraded Regex-only fallback mode.	Use one email per demo cycle. If rate limited, the system still responds correctly via fallback — the response will simply note source_attribution: "Regex Fallback".
Risk 2	SQLite Write Concurrency	Do not open the dashboard in	Keep a single browser tab open during the

© UMHackathon 2026

Email: umhackathon@um.edu.my

		multiple browser tabs and click "Execute Decision" simultaneously. The SQLite ERP file will lock and throw a 500 Internal Server Error.	live demo. This limitation is documented in DEF-05 and mitigated in production via PostgreSQL.
Risk 3	Browser Compatibility	The dashboard UI micro-animations and flex layout were optimized specifically for Google Chrome or Microsoft Edge (Chromium-based). Safari may exhibit minor layout degradation on trade-off cards.	Use Google Chrome for all live demonstrations.

QA Recommendation & Sign-Off

Field	Detail
Overall Test Status	✅ All critical path tests passing
Automated CI/CD	✅ 4/4 unit tests passing in GitHub Actions pipeline
Known Open Issues	3 deferred items (DEF-05, DEF-06, DEF-07) — all non-blocking
Live Demo Readiness	✅ System is stable and ready for final round demonstration
Risk Level	🟡 Low-Medium — API rate limit is the only critical demo risk

QA Sign-Off Statement: ChainLogic AI has completed its final-round quality assurance cycle. All P0/Critical test cases have passed. All resolved defects are traceable to verifiable Git commits. Known deferred issues are non-blocking, transparently documented, and have clear production mitigation paths. The system is hereby signed off for live technical demonstration.
